REXPRIN Aspirin Tablets

Can an aspirin a day really prevent a heart attack? Rexprin Aspirin (USAN), also known as acetylsalicylic acid is a salicylate drug, often used as an analgesic to relieve minor aches and pains, as an antipyretic to reduce fever, and as an anti-inflammatory medication. Aspirin also has an antiplatelet, or "anti-coagulate", effect by inhibiting thromboxane prostaglandins, which under normal circumstances bind platelet molecules together to repair damaged blood vessels. This is why aspirin is used in long-term, low doses to prevent heart attacks, strokes, and blood clot formation in people at high risk for developing blood clots. It has also been established that low doses of aspirin may be given immediately after a heart attack to reduce the risk of another heart attack or of the death of cardiac tissue. The main undesirable side effects of aspirin are gastrointestinal ulcers, stomach bleeding, and tinnitus, especially in higher doses. In children and adolescents, aspirin is no longer used to control flu-like symptoms or the symptoms of chickenpox or other viral illnesses, due to the risk of Reye's syndrome.

YES U s e w h e n

Mild to moderate pain Increased risk of blood clotting Heart attack Stroke

EXCELLENT PAINKILLER AND ANTI-INFLAMMATORY

Use of Rexprin (Aspirin) is to treat the **various forms of arthritis-- including rheumatoid** arthritis, juvenile rheumatoid arthritis, osteoarthritis, and some other rheumatological diseases. About 23.3 percent of the population uses aspirin for this purpose.

* The side effects are seen in a small percentage of persons using the medicine. The benefits of using the drug usually out-weigh the side-effects. Your doctor is the best person to decide the use and dosage of any drug.
