

## **Dilpril**

#### **USES**

This drug belongs to a group of medications called ACE inhibitors. Dilpril ® is used to treat high blood pressure (hypertension) in adults and children. It works by relaxing blood vessels, causing them to widen. Lowering high blood pressure helps prevent strokes, heart attacks and kidney problems. This medication is also used with other drugs (e.g., "water pills"/diuretics, digoxin) to treat congestive heart failure.

### **DOSAGE**

Take this medication by mouth, usually once or twice a day; or as directed by your doctor. You may take this drug with or without food. Use this medication regularly in order to get the most benefit from it. Remember to use it at the same time(s) each day.

If you are taking this drug in the liquid suspension form, shake the bottle well before each use. Measure the dose out carefully.

Do not take potassium supplements or salt substitutes containing potassium without talking to your doctor or pharmacist first. This medicine can raise your potassium levels, which rarely can cause serious side effects such as muscle weakness or a very slow heartbeat. Tell your doctor immediately if either of these effects occur.

The dosage is based on your medical condition and response to therapy. The usual maximum dose for adults is 40 milligrams per day.
